

Here, the columns are defined. The grid elements' numbering will be like this

Now we can place one element anywhere we want just by defining where its row start and end will be

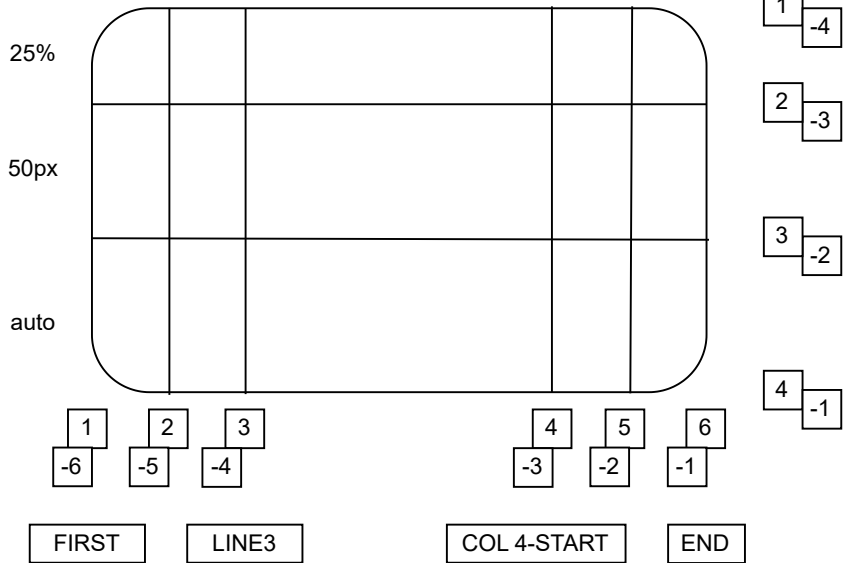

The space between two grid lines is grid track

Any area inside the grid is called grid area

## Grid Template Rows and Columns

ROW 1-START

ROW 1-END

THIRD LINE

LAST LINE

Rather than numbering, we can also give the lines name to identify

Using numbers / names, we can place any item in any place (either in a specific grid cell or in a grid area)

negative (reverse numbering)

positive (forward numbering)

e.g. [-1] and [6] are the same two lines
